BRINGING THE BEACH TO YOU WEST COAST REGION

 <p>WIREWEEED Wireweed is common along the Perth coast and forms large beds (meadows) in sandy areas. Seagrasses may provide nursery areas for juvenile fish.</p>	 <p>COMB ANCHOR The hooked base of a wireweed seedling is called a comb anchor. When the seedling is released from the main plant, it uses the hook to attach itself to the seafloor.</p>	 <p>KELP Kelp is commonly found washed ashore after rough seas. It mainly grows on limestone reefs, attaching itself with a holdfast.</p>	 <p>SARGASSUM <i>Sargassum</i>, meaning 'floating seaweed' in Spanish, is a type of brown algae. The small bubbles help it float in the water column.</p>	 <p>LOBED BUBBLE WEED This irregular shaped algae is found in the intertidal zone and to depths of ~15 m. It is generally more common in summer.</p>
 <p>STRAPWEED Strapweed or <i>Posidonia</i> is a common seagrass found along the Perth region. Seagrasses are extremely important in stabilising the sandy sea bed.</p>	 <p>FIBRE BALL These furry balls that wash up on the beach come from the seagrass <i>Posidonia</i> or strapweed. The leaves break off from the stem and are rolled into a ball by the waves and currents.</p>	 <p>VELVET SPONGE WEED Similar to dead man's fingers, velvet sponge weed has a firm but spongy texture and grows in irregular shapes. Another similar alga is the velvet golf ball.</p>	 <p>SLIMY BAGS Be careful if you break one of these red algae open. Slimy bags are filled with a thick slimy substance (their species name, <i>gloriosaccin</i>, means 'glue sacks').</p>	 <p>BROWN STRAPWEED Brown strapweed can grow to 2 m in length. It normally grows along rough coasts in temperate waters.</p>
 <p>PADDLEWEED Paddleweed is easy to recognise by its oval leaves. Unlike strapweed and wireweed, it does not form large beds (meadows).</p>	 <p>DEAD MAN'S FINGERS This green algae has tube-like forked branches, a firm but spongy texture and belongs to a group of algae called <i>Codium</i>.</p>	 <p>SEA LETTUCE This green algae is edible and is also an important food source for marine life, such as abalone.</p>	 <p>JELLYWEED This red algae was used in the early days to thicken jelly and blancmange (milk pudding).</p>	 <p>SEAGRASS FRUITS Seagrasses, like grasses on land produce flowers (fruits) and seeds.</p>
